SUBJECT INDEX

Aeroassisted orbital transfer vehicle (AOTV) 195
Air-breathing corridor 195
Air-breathing engines 183
Ammonia, oxidation mechanism 305

Cellular flames 203
  ammonium perchlorate at elevated pressures 236
  cell diameter variation with composition 217
  hydrocarbon–air mixtures 214
  hydrogen mixtures 220
  lean methane in air 220
  nonadiabatic burner data 228, 231
  nozzle burner data 227
  oxygen enrichment 227
  oxygen-enriched propane 231
  pressure dependence of 217
  replacement of N_2 by heavier inertants 234
  rich decane 217
  size of 212
Chebyshev polynomials 12, 16, 54
CHEMKIN 135
Coalescence/dispersion (C/D) models 43
Convection of flame sheet 78
Cyanuric acid RAPRENO$_x$ reaction mechanism 319

Damköhler number 19, 30, 58, 242, 256
Deflagration of flame front 79
Diffusion velocities in laminar flame fronts 207
Direct Lagrangian simulations 90
Direct numerical simulations 11
Droplet dynamics in high temperature environments 131
  boundary conditions 135
  computational times 156
  continuity equation and pressure field 139
  control volume equations 134
  low Mach number limits 134
  multi-component burning droplet 141
  numerical methods 136
  physical properties 135
  problem definition 132
  system equations 133
  two-dimensional flow with chemical reactions 149
  two-dimensional flow with vaporization 146

Enclosure fires, wall flows generated in, *See* Wall flows in enclosure fires
Eulerian numerical scheme 84

Fast flames
  analysis of structure equation 247
  Arrhenius kinetics 266
  as propellant for shock 263
  compressible-flow 259
  conditions near blow-up 268
  convected explosions 249
  derivation of equation for flame structure 246
  detonations 259
  diffusion-driven flames 247
  effect of Mach number on flame structure 247
  eigenvalue detonations 262
  fractional temperature change 251, 252
  hot spots 267
  in compressible flow 255
  in unbounded atmosphere 251
  induction domain equation 266
  induction evolution equation 268
  mole change 258
  piston/cylinder systems 269
  power sources 263
  propagation of 254
  quasi-steady 262
  quasi-steady combustion waves 251
  sonic singular point 259
  steady flow in half space 246
  subsonic 257
    behind a shock 262
    character of 256
  temperature behavior 258
  unsteady configurations 261
  unsteady flow 262
  unsteady induction domain 265
  wave propagation 267
Fluid compressibility 199
Flux correct transport (FCT) algorithm 95

Gauss–Lobatto Chebysev points 16

Hermite polynomials 12
Hugoniot curves 261
Hydrogen cyanide, oxidation mechanism 298
Hypersonic propulsion 183
Hypersonic vehicles, global geometry 187

Ievlev closure 8
Incompressible non-reactive flows 198
Initial-boundary value problems (IBVP) 194
Isotropic homogeneous-turbulence (IHT) 193, 198

Kelvin–Helmholtz stability of spatially growing layers 70
Knudson number 197

Lagrangian methods 65
Laguerre polynomials 12
Large Eddy Simulations (LES) 96
Legendre polynomials 12
Lewis number 208, 244, 255
LMSE model 9
Low calorific value gases (LCVG) 109
  advanced combustor concepts 125
  burning velocities 114
  characteristic reaction times 115
  combustion in fluidized, spouted and crater beds 124
  combustors with augmented flame stability 122
  combustors with convective and radiative heat recirculation 123
  combustors with inertial-convective interactions of flame with refractory wall 122

critical velocity gradients for flashback 115
effects of imperfect mixing 117
flame chemistry 111
flame stabilization in perfectly stirred adiabatic zone 117
flammability limits 113
internal heat recirculation by radiation 121
laminar flame properties 113
optimal size of combustor 121
pollutant emissions 112
relative value of 111
representative compositions of major sources 110
role of swirl 120
stability of stirred combustion reactor 115
swirl combustor with convective mixture preheat 126
swirl combustor with impingement mixture preheat 125
thermal and catalytic wall effects 119
Lundgren's near-Gaussian model 8

Mach number 134, 183, 184, 185, 187, 189, 195, 242, 244, 247, 255, 256, 263
Methane systems
ionic pathways in soot formation 284
polymerization induced by C_2 radicals 276
polymerization induced by CH_3 277
polymerization of C_2 species 276
polymerization pathways involving CH_2Cl 280
soot initiation 273
modelling the reaction 283
stoichiometry considerations 281
Model-free simulations 10
Molecular mixing, modelling of 6
Monte-Carlo numerical method 43

Navier–Stokes system 193, 194, 255
Nitric oxide
$NO \rightarrow HCN \rightarrow N_2$ reaction mechanism 301
production from fuel nitrogen 298
prompt mechanism 290
thermal mechanism 289
Nitrogen compounds in combustion processes 287
computational methods 288
HCN oxidation mechanism 298
NH_3 oxidation mechanism 305
NO production from fuel nitrogen 298
$NO \rightarrow HCN \rightarrow N_2$ reaction mechanism 301
NO_2 reaction mechanism 323
N_2O reaction mechanism 324
prompt NO mechanism 290
$RAPRENO_x$ reaction mechanism 319
reaction mechanism rate coefficients 331–8
reaction mechanisms 288
thermal De-NO_x reaction mechanism 312
thermal NO mechanism 289
total fixed nitrogen (TFN) 309
Nitrogen dioxide reaction mechanism 323
Nitrogen oxides, thermal De-NO_x reaction mechanism 312
Nitrous oxide reaction mechanism 324
Numerical mixing experiments 42
Nusselt number 147

Perturbation analysis 211
Poisson equation 66, 139
Prandtl number 255
Pressure rise due to combustion 81
Pseudospectral methods 14
applications of 16

Ramjet engines 186
Random vortex method 67
Rayleigh line flows 257
Reacting flow simulations
applications 82
theory 72
Reynolds number 3, 4, 46, 69, 70, 95, 133, 147, 192, 199
Reynolds stresses 198

SCRAMJET 186
Selective diffusional demixing 203
SHARP 95
Shvab–Zeldovich scalar variable 31, 55
Simple Line Interface Calculation (SLIC) 73
Soot initiation in methane systems 273
Spatially developing reacting shear flows 34
Spatially developing supersonic layers 39
Spectral element methods 45
applications of 52
Spectral (Galerkin) methods 11
Sturm–Liouville operator 12
Sub-grid-scale modeling 98
Supersonic combustor 189

Temporally developing reactor shear flows 20
Toor's hypothesis 18, 19
Total Variation Diminishing (TVD) methods 95
Transitional flow 192
Turbulence modeling 4, 198, 199
moment methods 5
pdf methods 5
closure at one-point level 7
closure at two-point level 8
closure of turbulent flux of pdf 9
Turbulent combustion 193
burning rate in 200
Turbulent reactive flows, model-free simulations of 1

ULTIMATE 95

Variable density simulations 25
Variable reaction kinetics simulations 30
Volume of Fluid (VDF) method 75
Volumetric expansion due to combustion 80
Vortex methods 65
applications of 68
improved 70

Wall flows in enclosure fires 159
application to typical enclosure fires 175
buoyancy-induced 163, 167, 173
boundary layer flow 164
ceiling-jet-driven 168
downward turning of ceiling jet 169
flow characteristics 171
laminar flow 164
negatively buoyant 169
negatively buoyant jets 178
negatively buoyant jets in extensive isothermal media 170
opposing buoyancy 169
penetration across interface in two-layer environment 173
penetration of wall jet 173
transport rates 165, 168
turbulent flow 165
wall heat transfer 172

ZND plane-detonation 243
ZND wave-structure 243
